

# Beyond the 8 Queens Problem

Dr. Yury Zavarovsky

The 8 Queens Problem is a well-known problem that asks you to place eight chess queens on an  $8 \times 8$  chessboard so that no two queens can attack each other. In this application, we consider the more general version of placing  $m$  chess queens on an  $n \times n$  chessboard. The problem has a solution if  $n > 3$  and  $m \leq n$ .

$$m \leq n \quad (1)$$

The work consists of two procedures. The first procedure, `Queens`, takes  $m$  (the number of queens) and  $n$  (the size of the chess board), returns the total number of solutions, and saves a complete list of all solutions (global variable  $S$ ).

The second procedure, `QueensPic`, displays selected solutions on a chessboard. Calls are all of the form `QueensPic(M, t)`, where  $M$  is a list of one or more solutions from  $S$ , and  $t$  is the number of solutions in each row of the display.

```
1 Queens := proc (m::posint, n::posint)
2 local It, K, l, L, M, P; global S, p, q;
3   It := proc (L)
4     local P, k, i, j;
5     M := []; k := nops(L[1]);
6     for i in L do
7       for j to n do
8         if convert([seq(j <> i[s, 2], s = 1 .. k)], `and`) and
9           convert([seq(1[k+1]-i[s, 1] <> i[s, 2]-j, s = 1 .. k)], `and`) and convert([seq(1[k+1]-i[s, 1] <> j-i[s, 2], s = 1 .. k)], `and`) then
10          M := [op(M), [op(i), [1[k+1], j]]]
11        end if
12      end do
13    end do;
14    M
15  end proc;
16 K := combinat:-choose(['$(1 .. n)'], m); S := [];
17 for l in K do
18   P := []; L := [seq([l[1], i], i = 1 .. n)];
19   P := [op(P), op((It@@(m-1))(L))];
20   S := [op(S), op(P)]
21 end do;
22 p := args[1]; q := args[2];
23 nops(S)
24 end proc;
25
26 QueensPic := proc (M, t::posint)
27 local m, n, HL, VL, T, A, N;
28 uses plottools, plots;
29 m := p;
30 n := q;
31 N := nops(args[1]);
32 HL := seq(plottools:-line([.5, .5+k], [.5+n, .5+k], color = black, thickness = 2), k = 0 .. n);
33 VL := seq(plottools:-line([.5+k, .5], [.5+k, .5+n], color = black, thickness = 2), k = 0 .. n);
34 T := [seq(plots:-textplot([seq([op(M[i], j)], Q], j = 1 .. m)], color = red, font = [TIMES, ROMAN, 24]), i = 1 .. N)];
35 if m <= n and 3 < n then
36   A := seq(plots:-display(HL, VL, T[k], axes = none, scaling = constrained), k = 1 .. N),
37   seq(plots:-display(plot([[0, 0]]), axes = none, scaling = constrained), k = 1 .. t*ceil(N/t)-N);
38   Matrix(ceil(N/t), t, [A]);
39   plots:-display(%)
40 end if
41 end proc;
```
